

Video Verification CCTV System

Our Innovation - Your Security
Electronic Security | Guarding Services | Fire Safety

This innovative, newly developed CCTV system from GB Security Group has been specifically designed for use in Churches across the UK.

Completely wireless detectors incorporating a motion sensor, night vision digital camera and infrared illuminators, self-powered with a 2 year battery life, ensures that crimes will no longer go undetected.

Utilising the very latest technologies, GBSG has developed this CCTV system to work seamlessly with our NSI Gold approved Remote Video Response Centre (RVRC), providing you with protection 24/7.

How does the Video Verification CCTV System work?

The Video Verification CCTV System provides all the benefits of a monitored CCTV system without the surveillance costs associated with it. By using this system the cameras only operate and record at an alarm activation, therefore removing the need for an operator to monitor the camera.

The remote camera and detection module can be fitted to the roof of the Church or any other vulnerable area. When the system is armed and the alarm is activated the corresponding camera records a 10 second clip of what caused the activation. This is then transmitted to the RVRC and the operators can then act upon the video footage by either identifying it as a false alarm or calling the corresponding authority/keyholder.

Sequence of events

Benefits of the Video Verification CCTV System

- Quick installation
- Neat solution which will blend into the building making the system very discreet
- Completely wireless so does not need cables installing
- Operates over the phone network so does not need a phone line
- Instant video verification of intrusion/activation
- Low running costs
- Camera and detection can be used both internally and externally
- Reduction of false alarms
- No installation damage to building

Why use this system?

There are many internal and external intruder alarm systems that are available which can provide effective protection for Churches. However a major disadvantage of these systems, is that when an intruder alarm activates it is the responsibility of the keyholder/Church Warden to attend the activation to find the cause. The down side to this is that the keyholder will be attending blind to the fact that there may be intruders and also the possibility that the intruders could be hiding on the roof and therefore remain undetected until the system has been reset.

The Video Verification CCTV System from GBSG overcomes all of these issues. As the detector starts to record immediately upon alarm activation, the RVRC is able to see within seconds, what has caused the alarm activation and therefore be able to identify if intruders are present. The keyholder and corresponding authority can then be informed of the events that lead to the alarm activation.

Security and the Church

Churches across the UK are experiencing an increase in crime as the price of scrap metal has doubled in the last 5 years, with lead now valued at £700 per tonne, making it a valuable target for criminals.

Local Police have advised, "Churches need to be extra vigilant in relation to this type of crime, especially owners of older properties which may have lead on the roof. Churches can also look at their CCTV, security lighting and apply anti-vandal paint to help prevent them from being targeted."

System Information

The Video Verification CCTV System is made up of the following equipment:

Outdoor PCAM Model DVC650 / DVC250 / DVC750

This is a battery operated, wireless, outdoor motion activated camera. It consists of a digital camera, a passive infrared motion detector, a S² view spread spectrum and encrypted wireless circuitry for secure two way communications with the control panel.

Panel with GPRS Communicator

A panel with GPRS communicator.

Keypad

Arming and disarming the system.

CCTV

Stand alone and fully monitored CCTV systems are playing an increasing role in crime prevention and prosecution, for small companies through to multi-nationals. They can also be combined with other services, such as access control, to enhance security and cut costs. We're a NACOSS Gold installer and were the first in the country to install to the exacting BS8418 standard.

FIRE ALARMS

Company responsibility for an approved fire system is now mandatory. The value lies in a well-designed system enabling early detection, maximising exit time and minimising damage to avoid business interruption. By integrating with intruder, CCTV and access, further safety, efficiency and usability can be achieved, including windows and doors automatically closing and gas supplies turned off.

GUARDING SERVICES

Whether round the clock or mobile patrols, manned site cover provides a security deterrent plus services like keyholding, access control, intruder alarm resets and other checks. The optimum solution may be to combine mobile patrols with remote CCTV systems for huge savings plus improved service. As an SIA approved contractor, all our guards are fully trained and licensed to exacting standards. Plus, every guard has the 24 hour back up of our BSIA approved manned control and monitoring centre.

INTRUDER ALARMS

A well-designed intruder system provides reliable, easy to use site security, allowing you to get on with your business. Integrating other services, such as CCTV and access control, can boost the benefits.

ACCESS CONTROL

Access control security systems can be PC based, intercom based or remotely managed. Each provides an effective way of controlling and monitoring access to your premises for both pedestrians and vehicles to improve security and efficiency. See even more value with intruder, fire and CCTV systems integrated.

Accreditations

We're fully approved with the National Security Inspectorate and accredited under the NACOSS Gold, NSI Fire Gold and BAFE Fire schemes. These industry schemes are recognised by insurers and demonstrate that our company will provide a service/installation which fully complies with the standard. We are also members of the British Security Industry Association.

GATES & BARRIERS

Gates and barriers are a flexible way of controlling pedestrian and vehicle access to your site. When integrated with access control, CCTV and intruder alarms, the benefits increase. Our range includes swing and sliding gates, road blockers and rising kerbs and bollards, turnstiles, disabled door entry and electric entrance doors.

CCTV MONITORING

Monitoring increases effectiveness in detector activated CCTV systems and can also help to simplify a huge range of functions - from remote operation of weighbridges to operating smoke machines. Our 24 hour, fully approved, remote video receiving centre allows us to provide a completely integrated service.

INTEGRATED SYSTEMS

We have a whole range of individual security solutions, but the big value comes in our expertise in identifying opportunities for integrated solutions. Integrated systems are the ultimate solution, giving greater security, efficiency and cost benefits by bringing together your different systems and technologies into one, seamless operation, including manned guarding where necessary. We make sure every part of your system talks the same language and works in harmony for a better solution. All delivered through one service supplier.

HOME SECURITY

A well-designed home security system allows you to feel as safe and comfortable at home as at work, and can significantly reduce insurance premiums too. All our systems are easy to use, reliable and provide long term, low cost performance.

As an accredited NACOSS Gold installer we can install both audible only and monitored solutions.
